

# Precision Test Patterns

**GAMMEX MA0436, GAMMEX MA0437, GAMMEX MA0438, GAMMEX MA0439, GAMMEX MA0647 (not shown)**

Precision test patterns provide an easy means of measuring the resolution and modulation transfer function of x-ray systems. They are compatible with all x-ray machines and are widely used by radiology equipment manufacturers.

Resolution in lp/mm of a mammographic system is an objective means of monitoring image quality. The Mammographic Gold Line Pair Resolution Test Pattern **MA0647** provides 5 to 20 lp/mm. The pattern is constructed of a gold-nickel alloy. This construction provides high contrast resolution patterns in the mammographic energy range. The wafer is equivalent to 25 microns of lead or 2.6 mm of aluminum at 20 KeV. Overall size is 10 mm by 25 mm.

The resolution patterns all have specific applications. Group test patterns have varying numbers of line pair groups, with radiopaque numbers to indicate the resolution (in lp/mm) of each group.
